MCA FULL STACK DEVELOPMENT

Practical Report — Question 8

Student Portfolio Webpage

Course: MCA IBM — 1st Semester

Subject: Full Stack Development (CAPCMC105T)

Main file: index.html **Stylesheet:** style.css

1. Objective

To create a student portfolio webpage that presents academic and personal information using semantic HTML5, navigation links, a contact form, multimedia, a figure with caption, a canvas drawing, and CSS styling.

2. Requirements Demonstrated

• Meta tags for character encoding, page description and responsive viewport.

• Header with student name and profile image; navigation links to About, Education, Skills and Contact.

• Main content with About Me and Education sections.

• Article elements for education entries and project descriptions.

• Aside element for skills and quick information.

• Figure and figcaption for the project illustration.

• Student contact form with text and email inputs, radio buttons, checkboxes, select menu, textarea, Submit and Reset controls.

• Audio element with browser playback controls.

• Canvas element drawn using JavaScript to show a 60% learning progress bar.

• Footer containing contact, copyright and Back to Top information.

• CSS classes, IDs, hover states and a responsive layout.

3. Key HTML and CSS Concepts

Semantic HTML: header, nav, main, section, article, aside and footer communicate the role of different page areas. **Forms:** label, input, fieldset, legend, select, textarea and button provide the form controls. The for/id pairing associates labels with their controls. Required fields and the email input type use built-in browser validation.

Media and graphics: img displays images, figure groups an image with figcaption, audio embeds playable audio, and canvas provides a drawing surface. JavaScript obtains a 2D canvas context and draws a background, text and progress bars.

CSS: selectors target elements and classes; flexbox aligns the profile and navigation; spacing, borders, rounded corners and shadows style cards; :hover and :focus provide interaction feedback; the media query adjusts the layout for smaller screens.

4. Browser Output Screenshots

The following screenshots were supplied by the student as browser output evidence. They show the rendered portfolio sections and controls.

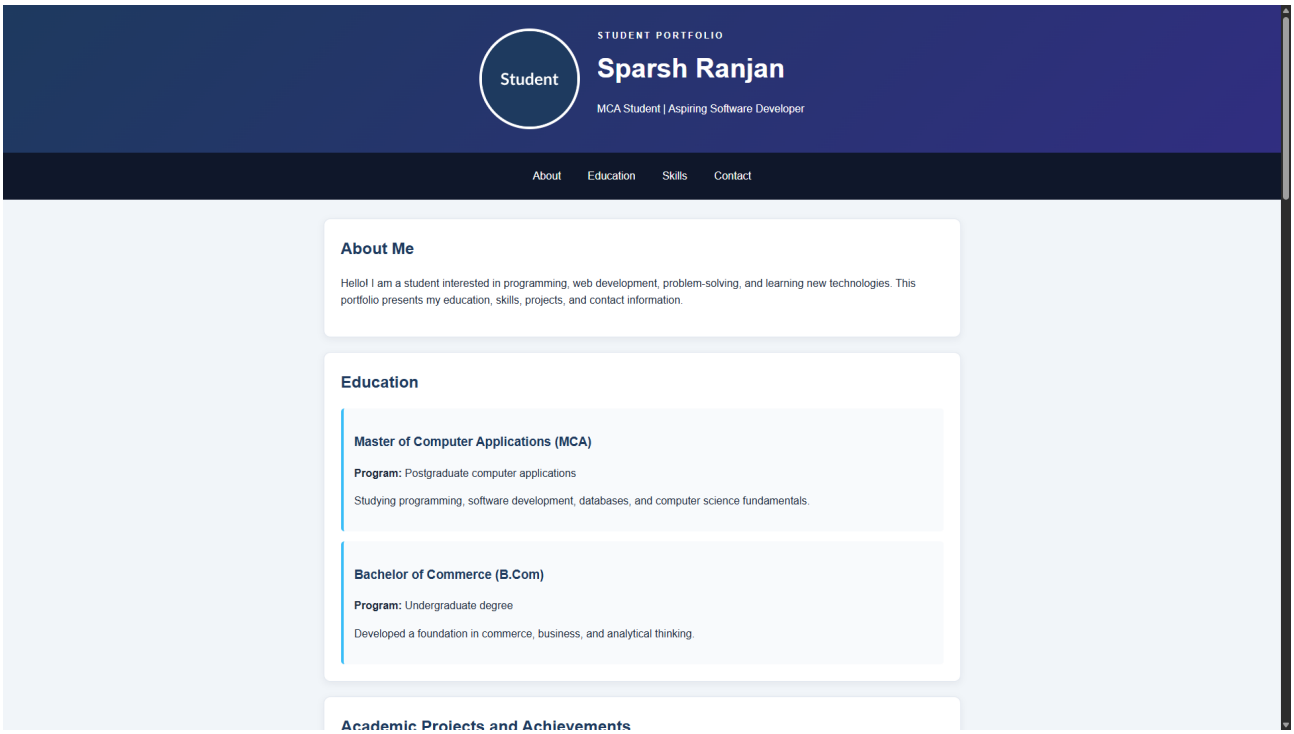

Figure 1. Portfolio header, navigation, About Me and Education sections.

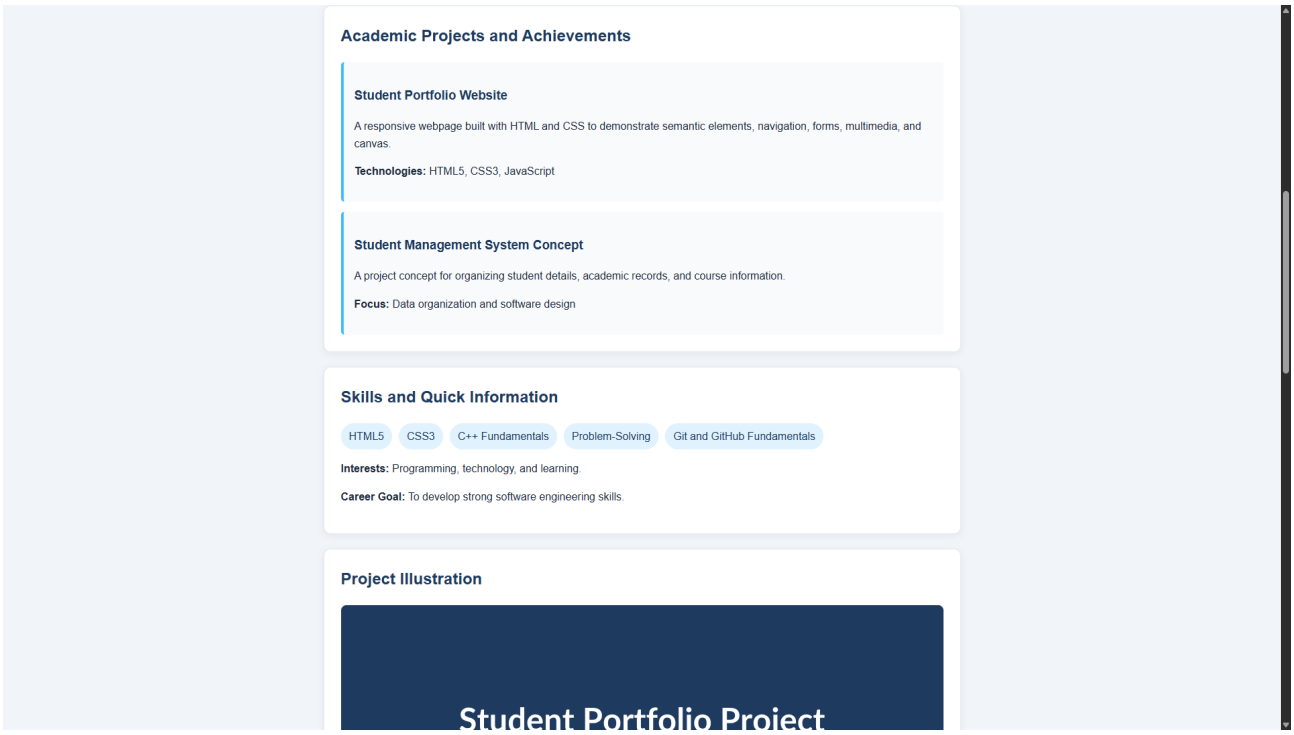

Figure 2. Academic projects, skills and project illustration.

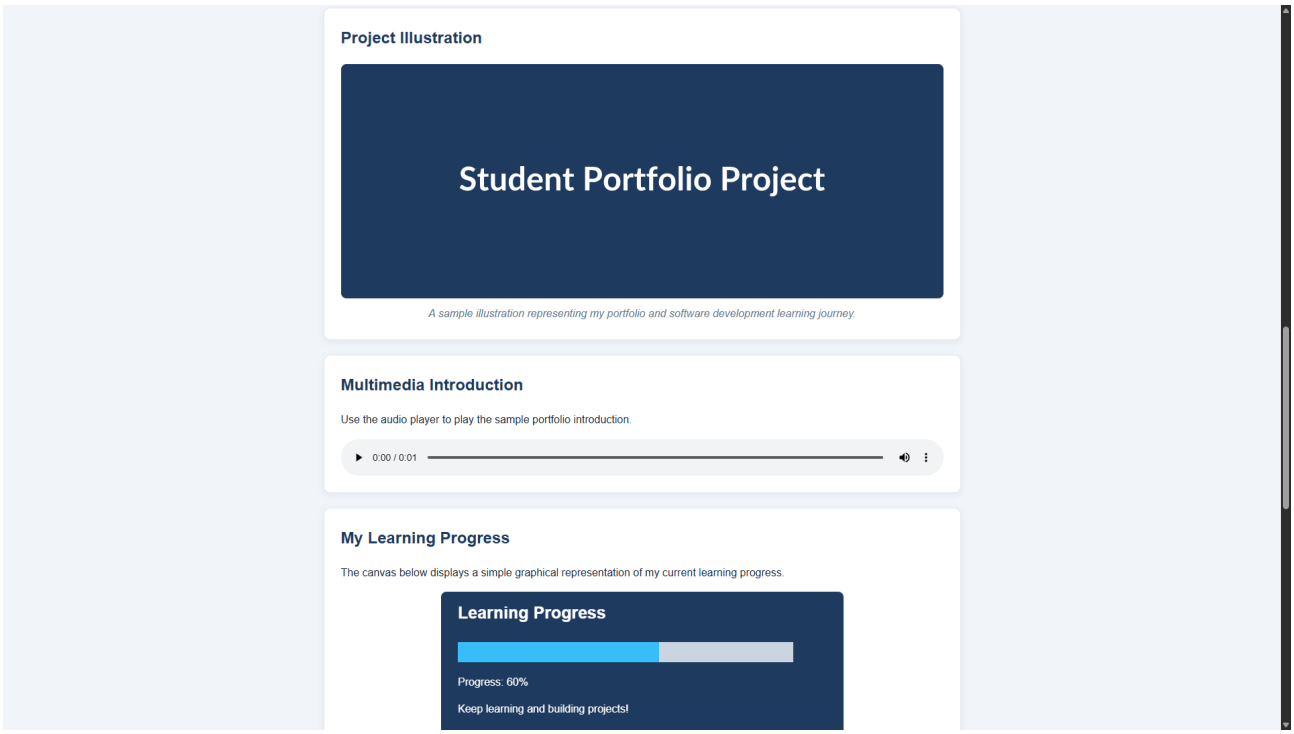

Figure 3. Project illustration, audio player and canvas progress graphic.

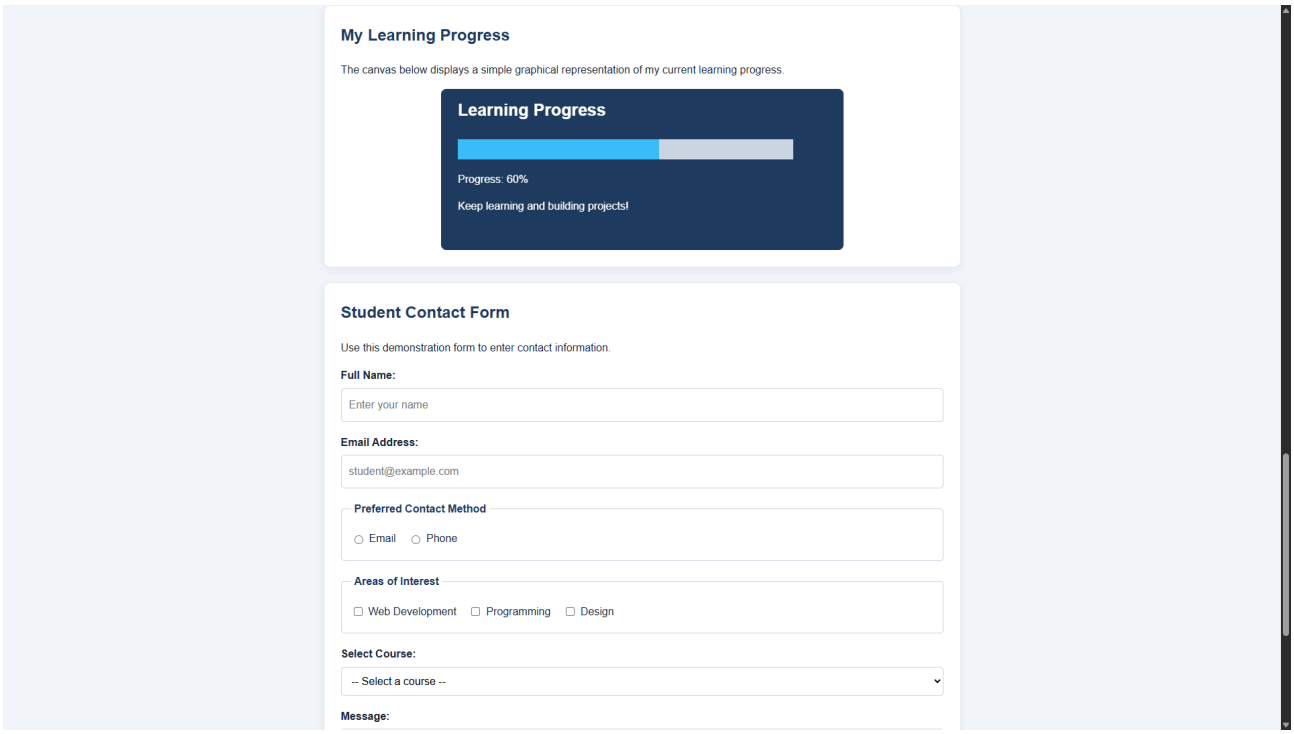

Figure 4. Canvas learning progress and student contact form.

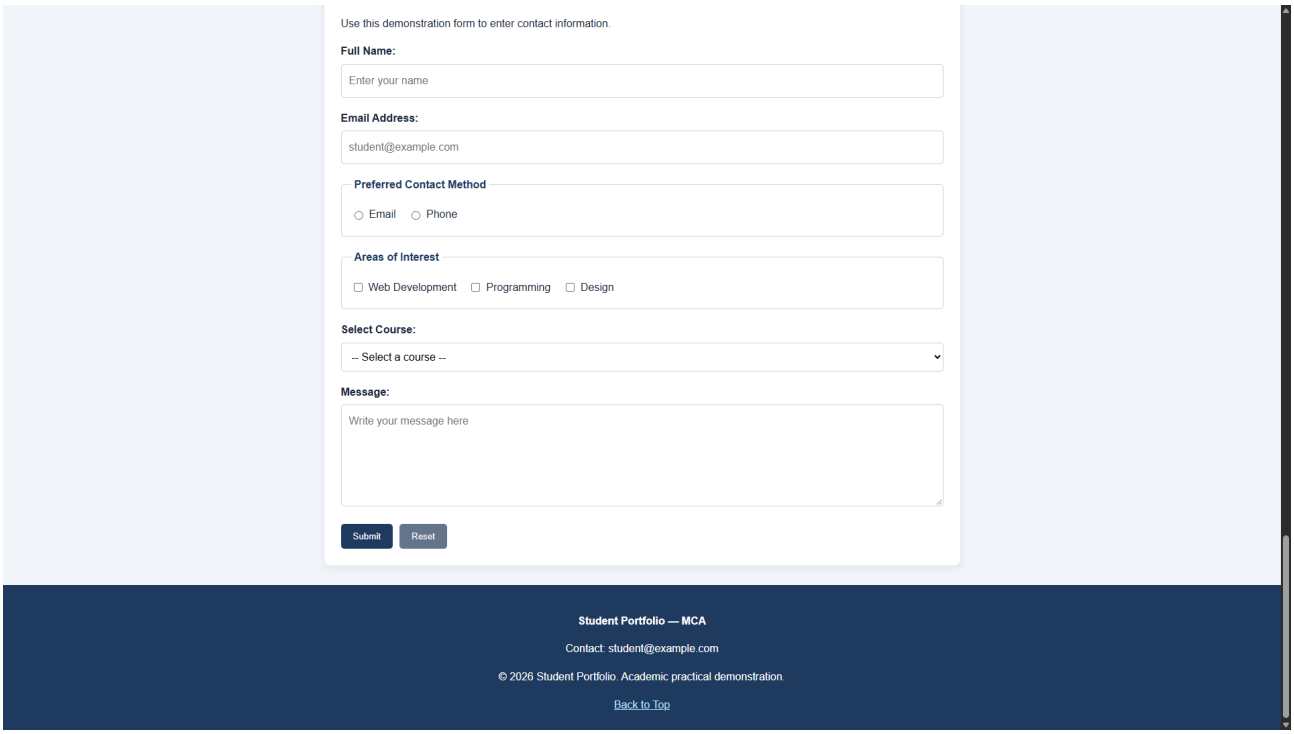

Figure 5. Contact form controls and page footer.

5. Verification Checklist

■ Page header and navigation links are visible.

■ About, Education, Projects and Skills sections are displayed.

■ Project image and figcaption are visible.

■ Audio control is present (audio source is external and requires internet access).

■ Canvas renders the Learning Progress graphic.

■ Contact form includes text, email, radio, checkbox, select, textarea, Submit and Reset controls.

■ Footer includes contact and copyright information.

■ Responsive CSS is included for narrow screens.

6. Result and Limitations

The supplied screenshots show the portfolio rendered in a browser, including its canvas graphic and form. The form is a front-end demonstration only; it does not store or send submitted data to a server. Placeholder images and the sample audio are loaded from external URLs and may require an internet connection. The screenshots do not independently prove that every link or form submission was tested.

7. GitHub Submission Commands

Run these commands from the repository root in PowerShell:

```
git status
git add 02_MCA_Lab_2/Q8_Student_Portfolio
git add 04_Submission_PDFs/Q8_Student_Portfolio_Practical_Report.pdf
git commit -m "Add Q8 student portfolio practical"
git push
```

Submission note: Keep index.html and style.css together in the Q8 folder. Before submission, ensure the files in the repository match the version shown in the screenshots.
