Q5 — Frames & Forms (Combined)

MCA Full Stack Development Lab Report

Objective: Create a multi-page HTML frameset with navigation links and a student registration form using common HTML form controls.

Technologies: HTML and CSS.

1. Practical Overview

The submitted screenshots show a two-panel layout with a left navigation area and a right content area. Navigation options include Home, Student Registration, and About. The content views include a welcome page, a registration form, and an About page.

2. Frames and Navigation

The practical uses a frameset page to divide the browser window into separate areas. The navigation links target a named content frame so that the selected page opens in the right-hand panel. The screenshot evidence shows the navigation and the corresponding content pages.

3. Form Elements Demonstrated

Control	Purpose
Text input	Accepts a student's name.
Password input	Masks typed characters on screen.
Email input	Provides browser email-format validation.
Radio buttons	Allow one gender option to be selected.
Checkboxes	Allow multiple interests to be selected.
Select dropdown	Allows the user to choose a course.
Textarea	Accepts a multi-line address.
Submit button	Attempts to submit the form.
Reset button	Resets controls to their initial values.
name, id, class	Identify controls, connect labels, and apply styling.

4. CSS Concepts

The stylesheet applies a dark-blue navigation panel, contrasting navigation links, a light page background, centered content containers, spacing, borders, rounded corners, and button hover styles. Form controls are styled to align consistently and remain readable.

5. Browser Evidence

The following screenshots were supplied by the student. They show the navigation panel, home content, blank and filled registration forms, and the About page.

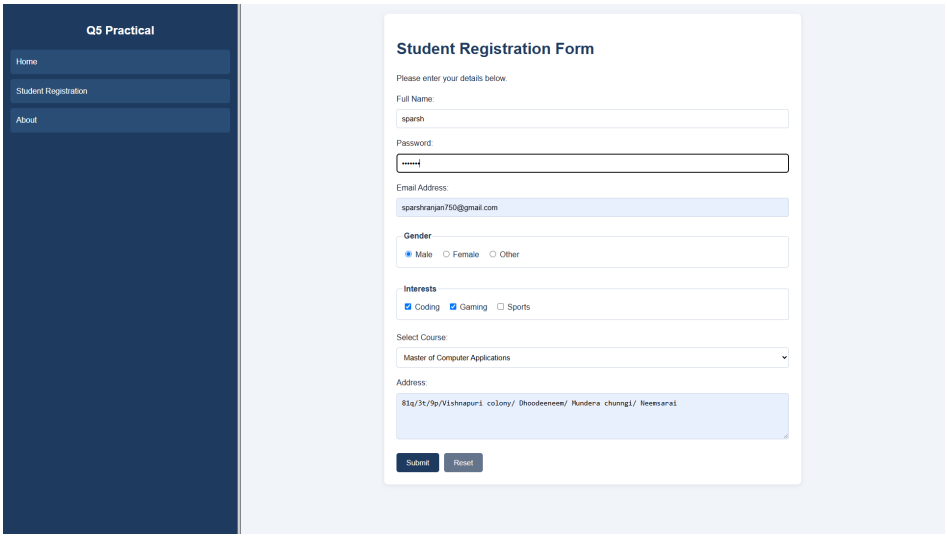

Figure 1. Navigation panel with Home, Student Registration, and About links.

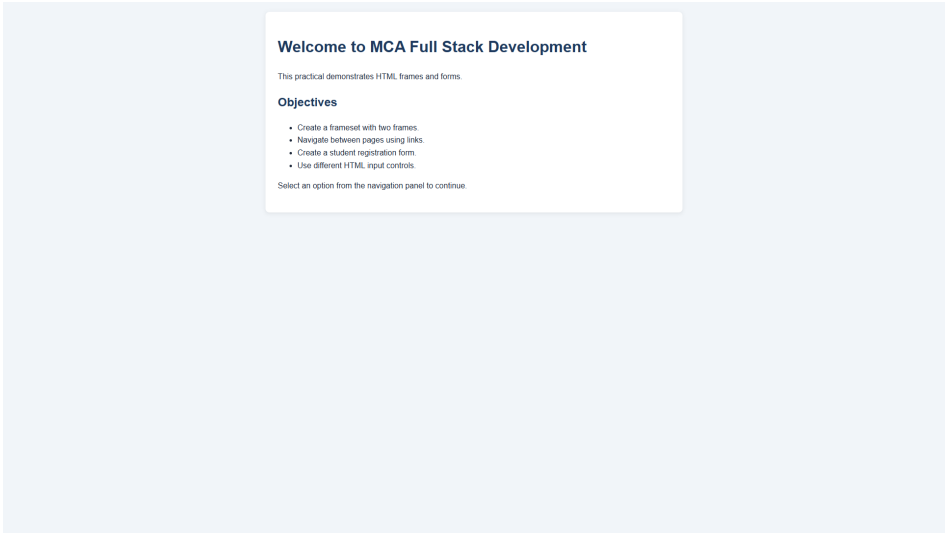

Figure 2. Home content page describing the practical objectives.

Browser Evidence (continued)

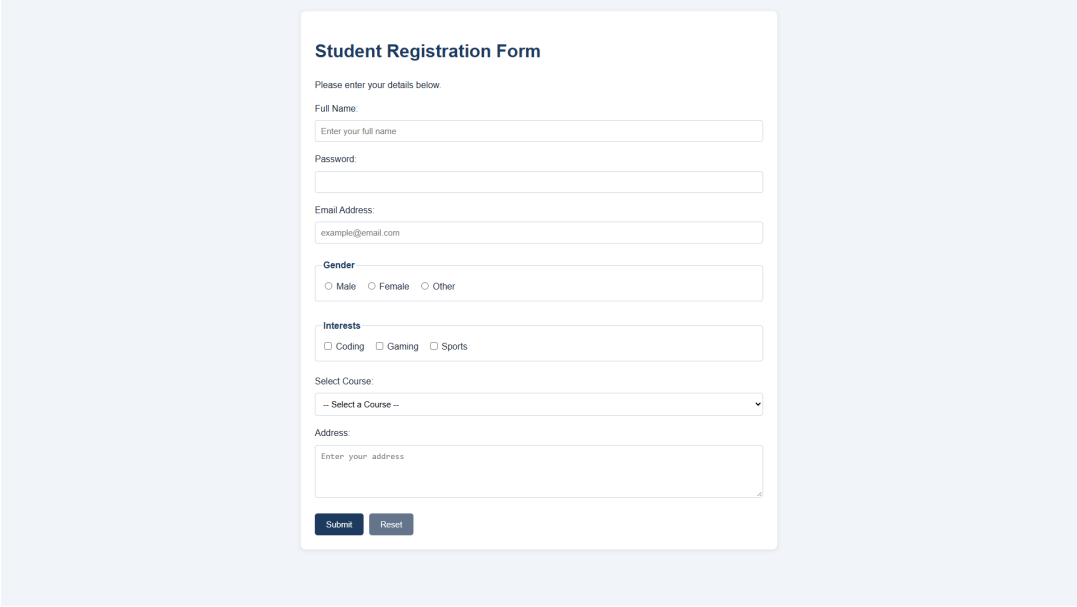

Figure 3. Student Registration Form showing all required controls.

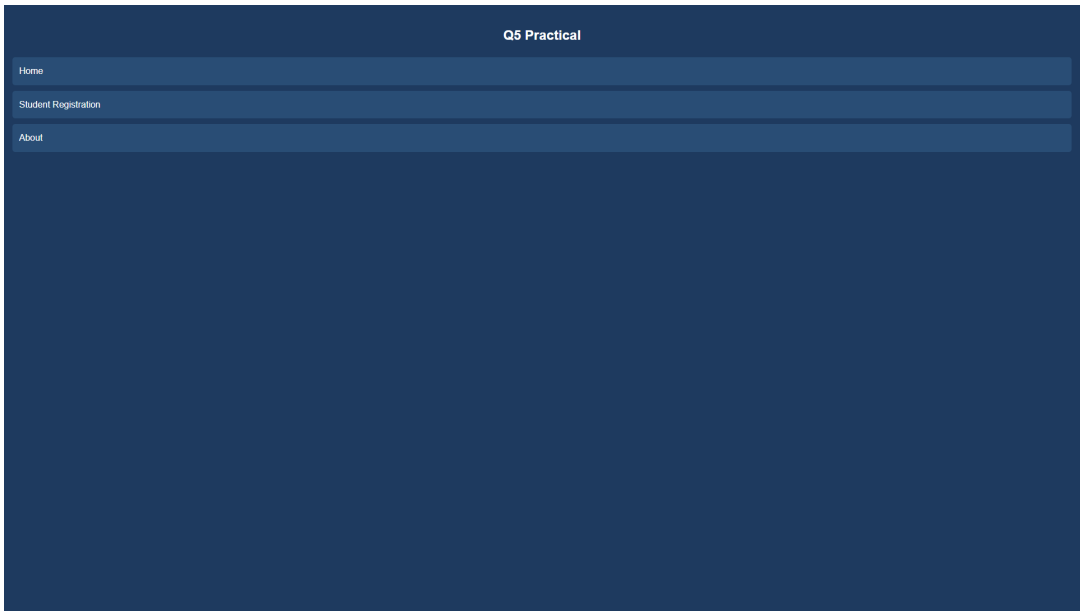

Figure 4. Example of the registration form with sample values selected.

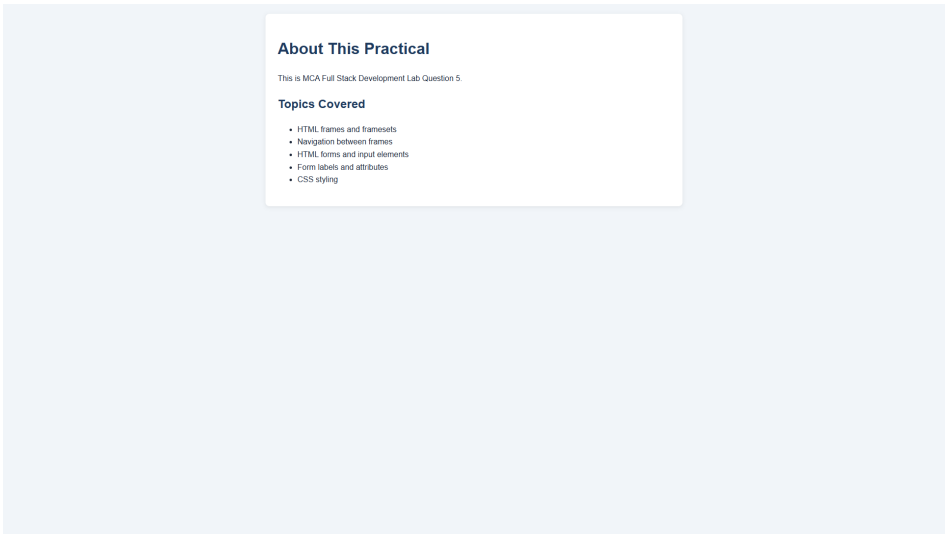

Figure 5. About page listing the concepts covered.

6. Result and Limitations

The screenshots show the expected visual pages and form controls. The form uses a demonstration action and does not store registrations on a server. The legacy frameset elements are included because this practical explicitly asks for frames; they are obsolete in modern HTML. The screenshots document visual behavior but do not independently prove every source-code attribute or successful server-side submission.

7. Submission Checklist

- Keep frameset.html, nav.html, content.html, form.html, about.html, and style.css together.
- Keep the supplied screenshots in the screenshots folder.
- Verify the saved source files match the pages shown in the browser.
- Add the Q5 folder and report to the existing GitHub repository.
